

Datasets

Three Stata 13.0 datasets are included. Those datasets differ in the structure of the data. More specifically, the statistical analysis of the ranking stage (Table 2) and the money-burning stage (Table 6) demand a specific data structure.

EER-D-17-00428_data_main.dta:

- Contains data from the experiment (all roles)
- Used in Tables 1, 3, 4, and 7.

EER-D-17-00428_data_ranking.dta:

- Contains data from the ranking stage.
- All participants face a panel of seven participants to rank from the most (rank=1) to the least (rank=7) preferred. One observation in the dataset corresponds to the ranking decision of participant i in regard to candidate j . The database therefore includes seven observations per participant.
- Used in Table 2.

EER-D-17-00428_data_unemployed.dta:

- Contains data from the money-burning stage.
- Unemployed participants can either target specific individuals in the society (they face the two employers and four workers in the experimental society – six observations) or burn money of both employers and workers without distinction (one observation).
- Used in Tables 5 and 6.

All variables in these datasets are labeled to clarify their meaning

Stata Do-file

EER-D-17-00428_data_Dofile

- Compilation of all Stata commands needed to replicate the estimates from the paper.
- The datasets required for the estimates are always stated in the beginning of their respective section.
